# Chapter 1

## Unit 1: Astronomy

### 1.1 Measuring the Universe

#### 1.1.1 Some important constants

The speed of light  $c$ :

$$c = 3.00 * 10^8 \frac{m}{s} (3SD)$$

The distance of a light year:

$$\text{A light year} = 9.4608 * 10^{15} m (3SD)$$

The distance between **Earth** and **Sun** refers to the *Astronomical Unit (AU)*

$$AU = 1.4958 * 10^{11} m (3SD)$$

One Parsec is

$$\text{Parsec} = 3.0824 * 10^{16} m (3SD)$$

#### 1.1.2 Unit Conversion

*Example.* If 1 inch = 2.54 cm, then 4.5 inches is equivalent to how many cm?

$$4.5 \text{ inch} * \frac{2.54 cm}{1 \text{ inch}} = 11.43 \text{ cm}$$

$$\therefore 1 \text{ inch} = 2.54 cm$$
